# Data Base Schema

## Assumptions Listed

1. Assuming that Rpt\_Dst\_No is more unique than Area or Area\_Name so that is left in the incidents table.
2. Assuming that neither Location, Cross\_Street, Lon, or Lat are unique enough to be a primary key.
2. A crime can happen without a weapon since some of the values for weapon are null
3. Crime code can have no description it can be null.
4. I am assuming that part should go with crime\_cd\_description.
5. Cross street can be null since there are missing data values.
6. There is no unique identifier for victim even if we made a surrogate key we would end up with repeated values in the database, so they are kept in the incident table.

## 6 Queries Planned

- **Most Frequent Crimes (Join)**

This query identifies the top 5 most commonly reported crime types across all incidents. The tables used are incident, crime\_code, and crime\_code\_description. I will join the incident and crime\_code tables on the DR\_NO column. Then, I will join the result with crime\_code\_description to retrieve the crime descriptions. Finally, I will count the frequency of each crime description, sort them in descending order, and display the top 5 results.

- **All Areas with or without Incidents (Outer Join)**

This query lists all LAPD divisions along with the number of incidents reported in each, including divisions with zero incidents. I will perform a LEFT JOIN from the area table to the incident table using the AREA column. Then, I will group the results by AREA and count the number of incidents per division, ensuring all areas are displayed even if they had no incidents.

- **Mo\_Codes never used in any incident (Set Theory)**

This query identifies and displays all Modus Operandi (MO) codes that are defined in the mocode\_description table but have never been used in any reported incident. This is a set difference operation: selecting all MO codes from mocode\_description and subtracting those that appear in the mocode table. The result is a list of unused MO codes along with their descriptions.

- **Monthly Crime Counts per Reporting District (Aggregation with Join)**

This query displays the number of incidents reported in each reporting district per month. The tables used are rpt\_no and incident. I will join the incident table with the rpt\_no table using the RPT\_DIST\_NO column, extract the month from DATE\_OCC, and group the results by both reporting district and month.

- **Firearm related incidents**

This query shows all incidents involving a firearm. The tables used are incident and weapon. I will join the incident and weapon tables on the Weapon\_Used\_Cd column, then filter the results to include only those with firearm-related weapon descriptions such as "HANDGUN", "RIFLE", "OTHER FIREARM", and similar.

- **Firearm incidents involving female victims**

This query shows all firearm-related incidents involving female victims, grouped by month. The tables used are incident and weapon. I will join these tables on the Weapon\_Used\_Cd column and filter for records where Vict\_Sex = 'F' and the weapon description includes firearm-related terms. Then, I will extract the month from DATE\_OCC and group the results to count the number of such incidents per month.
